

■ Display

`Display[channel, graphics]` writes graphics to the specified output channel.

The output channel can be a single file or pipe, or a list of them. ■ `Display` writes graphics in PostScript form. ■ The `graphics` in `Display` can be `Graphics`, `Graphics3D`, `SurfaceGraphics`, `ContourGraphics` or `DensityGraphics`. ■ The PostScript produced by `Display` does not include initialization or termination commands, nor does it include text font definitions. ■ `$DisplayFunction` is usually given in terms of `Display`. ■ If any of the specified files or pipes in `channel` are not open, `Display` uses `OpenWrite` to open them, then closes these particular files or pipes when it has finished. ■ See page 292. ■ See also: `Write`, `Show`.
