

## ■ Do

`Do [expr, {imax}]` evaluates *expr* *imax* times.

`Do [expr, {i, imax}]` evaluates *expr* with the variable *i* successively taking on the values 1 through *imax* (in steps of 1).

`Do [expr, {i, imin, imax}]` starts with *i* = *imin*. `Do [expr, {i, imin, imax, di}]` uses steps *di*.

`Do [expr, {i, imin, imax}, {j, jmin, jmax}, ...]` evaluates *expr* looping over different values of *j*, etc. for each *i*.

`Do` uses the standard *Mathematica* iteration specification. ■ `Do` evaluates its arguments in a non-standard way (see page ??).

■ The result of `Do` is `Null`. ■ See page 254. ■ See also: `For`, `While`, `Table`, `Nest`.
