

■ EndPackage

`EndPackage[ ]` restores `$Context` and `$ContextPath` to their values before the preceding `BeginPackage`, and prepends the current context to the list `$ContextPath`.

Every call to `EndPackage` must be balanced by an earlier call to `BeginPackage`. ■ `EndPackage` is typically used at the end of a *Mathematica* package. ■ `EndPackage` returns the name of context it ends. ■ `EndPackage` resets the values of both `$Context` and `$ContextPath`. ■ See page 310.
