

■ Apply

`Apply[f, expr]` or `f @@ expr` replaces the head of *expr* by *f*.

`Apply[f, expr, levelspec]` replaces heads in parts of *expr* specified by *levelspec*.

Examples: `Apply[f, {a, b, c}]` $\longrightarrow$ `f[a, b, c]`; `Apply[Plus, g[a, b]]` $\longrightarrow$ `a + b`. ■ Level specifications are described on page ??.

■ The default value for *levelspec* in `Apply` is `{0}`. ■ Examples:

`Apply[f, {{a,b},{c,d}}]` $\longrightarrow$ `f[{a, b}, {c, d}]`; `Apply[f, {{a,b},{c,d}}, 1]` $\longrightarrow$ `{f[a, b], f[c, d]}`;

`Apply[f, {{a,b},{c,d}}, {1}]` $\longrightarrow$ `{f[a, b], f[c, d]}`;

`Apply[f, {{a,b},{c,d}}, -2]` $\longrightarrow$ `{f[a, b], f[c, d]}`. ■ See page 169. ■ See also: `Map`, `Scan`, `Level`.
