

■ Equal

$lhs == rhs$ returns `True` if lhs and rhs are identical.

$lhs == rhs$ is used to represent a symbolic equation, to be manipulated using functions like `Solve`. ■ $lhs == rhs$ returns `True` if lhs and rhs are identical expressions. ■ $lhs == rhs$ returns `False` if lhs and rhs are determined to be unequal by comparisons between numbers or other raw data, such as strings. ■ Real numbers are considered equal if their difference is less than the precision of either of them. ■ `2 == 2.` gives `True`. ■ $e_1 == e_2 == e_3$ gives `True` if all the e_i are equal.

■ `Equal[e]` gives `True`. ■ See page 72. ■ See also: `SameQ`, `Unequal`, `Order`.
