

## ■ Exponent

`Exponent[expr, form]` gives the maximum power with which *form* appears in *expr*.

`Exponent[expr, form, h]` applies *h* to the set of exponents with which *form* appears in *expr*.

*expr* is assumed to be a single term, or a sum of terms. `Exponent` applies only to the top level in *expr*. ■ Example:

`Exponent[x^2 + a x^3, x] → 3`. ■ The default taken for *h* is `Max`. ■ Example:

`Exponent[x^2 + a x^3, x, List] → {2, 0, 3}`. ■ *form* can be a product of terms. ■ See page 383. ■ See also: `Coefficient`, `Cases`.
