

■ FaceForm

`FaceForm[pf, pb]` is a three-dimensional graphics primitive which specifies that the front faces of polygons are to be drawn with the graphics primitive *pf*, and the back faces with *pb*.

The graphics specifications *pf* and *pb* must be either `GrayLevel[i]` or `RGBColor[r, g, b]`. ■ Specifications given outside of `FaceForm` will apply both to the front and back faces of polygons. ■ The front face of a polygon is defined to be the one that has an outward normal when the corners are taken in the order you specify them. ■ See page 149. ■ See also:
