

## ■ GrayLevel

`GrayLevel` [*level*] is a graphics primitive which specifies that graphical objects which follow are to be displayed, if possible, with the gray level intensity specified.

The gray level must be a number between 0 and 1. ■ 0 represents black; 1 represents white. ■ On display devices with no native gray-level capability, dither patterns are typically used, as generated by the `PostScript` interpreter. ■ See pages 129, 142 and 149. ■ See also: `RGBColor`, `ContourGraphics`.
