

■ MapAll

`MapAll[f, expr]` or `f //& expr` applies *f* to every subexpression in *expr*.

Example: `MapAll[f, {{a,b},{c,d}}] → f[{f[{f[a], f[b]}], f[{f[c], f[d]}]}]`. ■ `MapAll[f, expr]` is equivalent to `Map[f, expr, {0, Infinity}]`. ■ See page 169. ■ See also: `ExpandAll`, `ReplaceAll`.
