

■ MemberQ

`MemberQ`[*list*, *form*] returns `True` if an element of *list* matches *form*, and `False` otherwise.

form can be a pattern. ■ Example: `MemberQ[x^_, {x^2, y^2}]` $\longrightarrow$ `False`. ■ The first argument of `MemberQ` can have any head, not necessarily `List`. ■ See page 230. ■ See also: `FreeQ`, `Count`, `Cases`.
