

■ MemoryConstrained

`MemoryConstrained[expr, b]` evaluates *expr*, stopping if more than *b* bytes of memory are requested.

`MemoryConstrained` generates an interrupt to stop the evaluation of *expr* if the amount of additional memory requested during the evaluation of *expr* exceeds *b* bytes. ■ `MemoryConstrained` returns `$Interrupted` if the evaluation is interrupted. ■ `MemoryConstrained` has attribute `HoldFirst`. ■ See page 321. ■ See also: `TimeConstrained`, `MaxMemoryUsed`, `$RecursionLimit`.
