

■ Needs

`Needs["context`"]` loads a file if the specified context is not already in `$ContextPath`.

`Needs[string]` reads in a file with name `str.m`, where `str` is `string` with any trailing ``` removed. ■ If there are ``` within the string `str`, `Needs` constructs several different file names to try and read in. `Needs` replaces ``` in order by `/`, `_` and `..` ■ See page 311. ■ See also: `Get`.
