

■ NonNegative

`NonNegative[x]` gives `True` if x is a non-negative number.

`NonNegative[x]` gives `False` if x is manifestly a negative number. Otherwise, it remains unevaluated. ■ A definition like `NonNegative[x] = True` effectively specifies that x is a non-negative number. ■ Definitions for `Sign` are tested in determining whether linear combinations of expressions are non-negative. ■ See page 242. ■ See also: `Negative`, `Positive`, `Sign`.
