

■ NumberForm

`NumberForm[expr, n]` prints with approximate real numbers in *expr* given to *n* digit precision.

`NumberForm` can print the digits in a number in blocks, with breaks in between. ■ The following options can be given:

<code>DigitBlock</code>	<code>Infinity</code>	number of digits between breaks
<code>ExponentStep</code>	<code>1</code>	size of steps in the exponents generated
<code>NumberPoint</code>	<code>"."</code>	decimal point string
<code>NumberSeparator</code>	<code>","</code>	character to insert at breaks between blocks

- The setting of the option `DigitBlock` affects the printing not only of approximate real numbers, but also of integers.
- See page 328. ■ See also: `ScientificForm`, `EngineeringForm`.
