

■ OneIdentity

`OneIdentity` is an attribute that can be assigned to a symbol f to indicate that $f[x], f[f[x]]$, etc. are all equivalent to x for the purpose of pattern matching.

Functions like `Plus` and `Times` have the attribute `OneIdentity`. ■ The fact that `Times` has attribute `OneIdentity` allows a pattern like `n_. x_` to match `x`. ■ See page 214. ■ See also: `Flat`, `Nest`.
