

■ OpenRead

`OpenRead["file"]` opens a file to read data from.

`OpenRead` prepares to read from a file, starting at the beginning of the file. ■ On systems that support pipes, `OpenRead["!command"]` runs the external program specified by *command*, and opens a pipe to get input from it. ■ The function `ReadList` automatically opens files or pipes that it needs. ■ See page 302. ■ See also: `Close`, `Read`, `ReadList`.
