

■ PageHeight

`PageHeight` is an option for `OpenWrite` etc. and `ResetMedium` which specifies how many lines of text should be printed between page breaks.

With `TextRendering -> Plain`, `PageHeight` gives the actual numbers of lines generated. ■ With

`TextRendering -> PostScript`, `PageHeight` gives the number of `m` spaces (number of times the width of an `m` character).

■ `PageHeight -> Infinity` specifies that there should be no page breaks. ■ See page 295. ■ See also: `TotalHeight`.
