

■ Permutations

`Permutations[list]` generates a list of all possible permutations of the elements in *list*.

Example:

`Permutations[{a,b,c}]` $\longrightarrow$ `{{a, b, c}, {a, c, b}, {b, a, c}, {b, c, a}, {c, a, b}, {c, b, a}}`.

■ There are $n!$ permutations of a list of n elements. ■ Each element of the original list is treated as distinct. ■ The object *list* need not have head `List`. ■ See page 106. ■ See also: `Sort`, `Signature`, `Reverse`, `RotateLeft`.
