

■ PlotColor

`PlotColor` is an option for graphics functions that specifies whether color output should be produced.

`PlotColor -> True` generates color `PostScript`. ■ Colors are specified by `RGBColor` graphics primitives, or by giving colors for simulated illumination. ■ `PostScript` interpreters should average colors to give gray scales on monochrome display devices. ■ When `PlotColor -> False`, no color primitives appear in the `PostScript` output. ■ See page 109. ■ See also: `AmbientLight`, `LightSources`.
