

■ Point

`Point[coords]` is a graphics primitive that represents a point.

The coordinates can be given either in the absolute form $\{x, y\}$ or $\{x, y, z\}$ or in scaled form `Scaled[{x, y}]` or `Scaled[{x, y, z}]`. ■ Points are rendered if possible as circular regions. Their radius can be specified using the graphics primitive `PointSize`. ■ Shading and coloring of points can be specified using `GrayLevel` or `RGBColor`. ■ See pages 142 and 149. ■ See also: `Text`.
