

■ Prefix

`Prefix[f[expr]]` prints with $f[expr]$ given in default prefix form: $f \ @ \ expr$.

`Prefix[f[expr], h]` prints as $hexpr$.

`Prefix[expr, h, precedence, grouping]` can be used to specify how the output form should be parenthesized. ■ See the notes for `Infix` about precedence and grouping. ■ See page 278. ■ See also: `Infix`, `Postfix`.
