

■ Print

`Print[ $expr_1$ ,  $expr_2$ , ...]` prints the $expr_i$, followed by a newline (line feed).

`Print` sends its output to the channel `$Output`. ■ `Print` uses `OutputForm` as the default format type. ■ `Print` concatenates the output from each $expr_i$ together, effectively using `SequenceForm`. ■ You can arrange to have expressions on several lines by using `ColumnForm`. ■ See page 282. ■ See also: `Message`, `Put`, `Write`.
