

■ Put

`expr >> filename` writes `expr` to a file.

`Put[expr1, expr2, ..., "filename"]` writes a sequence of expressions `expr`_{*i*} to a file.

On systems with advanced graphical interfaces, there will usually be graphical tools for saving expressions in files. ■ `Put` uses the format type `InputForm` by default. ■ `Put` starts writing output at the beginning of the file. It deletes whatever was previously in the file. ■ `Put` inserts a newline (line feed) at the end of its output. ■ `expr >> filename` is equivalent to `expr >> "filename"`. The double quotes can be omitted if the filename contains only the following non-alphanumeric characters: `.`, `/` and `~`. ■ It is conventional to use names that end with `.m` for files containing *Mathematica* input. ■ See page 286. ■ See also: `Save`, `Definition`, `Dump`, `Get`.
