

■ Quit

`Quit[ ]` terminates a *Mathematica* session, or an inspection session initiated within `Debug`.

All definitions that you have not explicitly saved in files are lost when the *Mathematica* session terminates. ■ Before terminating a session, *Mathematica* executes any delayed value that has been assigned to the global variable `$Epilog`. Conventionally, this attempts to read in a file `end.m` of commands to be executed before termination. ■ On most computer systems, `Quit[n]` terminates *Mathematica*, passing the integer *n* as an exit code to the operating system. ■ `Exit` is a synonym for `Quit`. ■ See page 579. ■ See also: `$IgnoreEOF`.
