

■ ReadList

`ReadList["file"]` reads all the remaining expressions in a file, and returns a list of them.

`ReadList["file", type]` reads objects of the specified type from a file, until the end of the file is reached. The list of objects read is returned.

`ReadList["file", {type1, type2, ...}]` reads objects with a sequence of types, until the end of the file is reached.

If *file* is not already open for reading, `ReadList` opens it, then closes it when it is finished. If the file is already open, `ReadList` does not close it at the end. ■ `ReadList` prints a message if any of the objects remaining in the file are not of the specified types. ■ `ReadList["file", {type1, ...}]` looks for the sequence of *type_i* in order. If the end of file is reached while part way through the sequence of *type_i*, `EndOfFile` is returned in place of the elements in the sequence that have not yet been read. ■ See notes for `Read`. ■ See pages 156 and 300.
