

■ Sign

`Sign[x]` gives -1, 0 or 1 depending on whether the real number x is negative, zero, or positive.

`Sign` tries simple transformations in trying to determine the sign of symbolic expressions. ■ You can define values for `Sign[expr]` which are used when *expr*, and linear combinations involving it, appear in `Sign`, as well as functions like `Positive` and `Negative`. ■ See page 341. ■ See also: `Abs`, `Positive`, `Negative`, `NonNegative`.
