

■ StringBreak

`StringBreak[n]` is output at the end of the n^{th} line where a string is broken.

`StringBreak` is used when symbol names, strings and numbers are broken. ■ You can think of `StringBreak` as being like a “hyphenation character”. ■ The default setting for `Format[StringBreak[_]]` is `"\"`. ■ You can specify what is printed when a string is broken by defining a new value for `Format[StringBreak[n_]]`. ■ See page 588. ■ See also: `Continuation`, `LineBreak`, `Indent`.
