

■ Sum

`Sum[f, {i, imax}]` evaluates the sum $\sum_{i=1}^{imax} f$.

`Sum[f, {i, imin, imax}]` starts with $i = imin$. `Sum[f, {i, imin, imax, di}]` uses steps di .

`Sum[f, {i, imin, imax}, {j, jmin, jmax}, ...]` evaluates the multiple sum $\sum_{i=imin}^{imax} \sum_{j=jmin}^{jmax} \cdots f$.

`Sum` evaluates its arguments in a non-standard way (see page ??). ■ `Sum` uses the standard *Mathematica* iteration specification. ■ The iteration variable i is treated as local. ■ In multiple sums, the range of the outermost variable is given first. ■ See page 69. ■ See also: `Do`, `Product`, `Table`.
