

■ TensorRank

`TensorRank[expr]` gives the depth to which *expr* is a full array, with all the parts at a particular level being lists of the same length.

`TensorRank[list]` is equivalent to `Length[Dimensions[list]]`. ■ Examples: `TensorRank[{a,b}]` $\longrightarrow$ 1; `TensorRank[{a,{b}}]` $\longrightarrow$ 1. ■ `TensorRank[expr, h]` looks for head *h* at each level. ■ See page 456. ■ See also: `Dimensions`, `Depth`, `VectorQ`, `MatrixQ`.
