

■ ToRules

`ToRules[eqns]` takes logical combinations of equations, in the form generated by `Reduce` or `Roots`, and converts them to lists of rules, of the form produced by `Solve`.

Example: `{ToRules[x==1 || x==2]} → {{x -> 1}, {x -> 2}}`. ■ `ToRules` discards nonequalities (`!=`), and thus gives only “generic” solutions. ■ See pages 394 and 476.
