

■ Union

`Union[list1, list2, ...]` gives a sorted list of all the distinct elements that appear in any of the *list_i*.

`Union[list]` gives a sorted version of a list, in which all duplicated elements have been dropped.

If the *list_i* are considered as sets, `Union` gives their union. ■ The *list_i* must have the same head, but it need not be `List`.

■ See page 103. ■ See also: `Join`, `Intersection`, `Complement`.
