

■ While

`While[test, body]` evaluates *test*, then *body*, repetitively, until *test* first fails to give `True`.

`While[test]` does the loop with a null body. ■ If `Break[ ]` is generated in the evaluation of *body*, the `While` loop exits.

■ `Continue[ ]` exits the evaluation of *body*, and continues the loop. ■ Unless `Return[ ]` or `Throw[ ]` are generated, the final value returned by `While` is `Null`. ■ Example: `i=0; While[i < 0, tot += f[i]; i++]`. Note that the roles of `;` and `,` are *reversed* relative to the C programming language. ■ See page 254. ■ See also: `Do`, `For`.
