

■ Write

`Write[channel, expr1, expr2, ...]` writes the expressions $expr_i$ in sequence to the specified output channel.

The output channel can be a single file or pipe, or list of them, each specified by a string giving their name. ■ `Write` is the basic *Mathematica* output function. `Print` and `Message` are defined in terms of it. ■ If any of the specified files or pipes are not already open, `Write` calls `OpenWrite` to open them. ■ `Write` does not close files and pipes after it finishes writing to them. ■ By default, `Write` generates output in the form specified by the setting of the `FormatType` option for the output media used. ■ See page 292. ■ See also: `Print`, `Display`, `Message`, `Read`.
