

■ Xor

`Xor`[$e_1, e_2, \dots$] is the logical `xor` (exclusive or) function.

It gives `True` if an odd number of the e_i are `True`, and the rest are `False`. It gives `False` if an even number are `True`, and the rest are `False`.

`Xor` gives symbolic results when necessary, and applies various simplification rules to them. ■ Unlike `And` and `Or`, `Xor` is not a control structure, and does not have attribute `HoldAll`. ■ See page 73. ■ See also: `LogicalExpand`.
