

■ CallProcess

`CallProcess["command", f, { $x_1$ ,  $x_2$ , ...}]` calls the function f in an external process, with arguments x_i .

`CallProcess` exchanges data with an external process using pipes. The external process must have been started using `StartProcess`. ■ The arguments x_i are passed in textual form to the external process. ■ See page 304. ■ See also: `RunThrough`, `Put`.
