

■ `$Context`

`$Context` is a global variable that gives the current context.

Contexts are specified by strings of the form `"name"`. ■ `$Context` is modified by `Begin`, `End` and `EndAdd`. ■ `$Context` is a rough analog for *Mathematica* symbols of the current working directory for files in many operating systems. ■ See pages 313, 550 and 577. ■ See also: `Context`.
